Office Action Summary	Examiner	Art Unit					
	Paula W. Klimach	2135					
The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply							
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).							
Status							
1) Responsive to communication(s) filed on 02 Se	eptember 2003.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 09/02/05 has been entered.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wasilewski et al (6,424,714 B1) in view of Hendricks et al (5,600,364), and further in view of Xiao (6,571,337 B1).

In reference to claim 1, Wasilewski discloses a system that provides conditional access to services (abstract), wherein the user can select an event (column 30 lines 32-47). The agent responds to the customer order by sending an EMM containing the necessary entitlement information (column 30 lines 48-67).

Wasilewski does not expressly disclose indicating the events that are available to the customer in the form of an electronic list of events.

ş

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to indicate the customer the types of events that are available in the form of a list of events. One of ordinary skill in the art would have been motivated to do this because a list is an organized and simple way of communicating information.

Although Wasilewski discloses the use of encrypted events, Wasilewski does not disclose the contents of the event information including at least one of a channel identity, date and time stamp, event identity and payment amount corresponding to said associated event.

Hendriks discloses the contents of the event information that comprise at least the channel ID (column 20 lines 4-18).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to include the event information as disclosed by Hendriks in the system of Wasilewski. One of ordinary skill in the art would have been motivated to do this because the information about the event enables the service provider to charge the user.

Although Wasilewski discloses the secure delivery of the event (programs) from the service provider to the customer set top unit (abstract), Wasilewski does not disclose a encrypted message comprising an descrambling key and authenticating a source of the digitally signed encrypted message in response to said digitally signed encrypted message and obtaining the descrambling key upon said authenticating.

Xiao discloses a method, apparatus and article of manufacture for a computerimplemented method of delayed secure data retrieval (abstract). The system comprises an encrypted message comprising a content key (descrambling key) and a description of the digital content (column 4 lines 17-33). The system authenticates a source of the digitally signed

Art Unit: 2135

encrypted message in response to said digitally signed encrypted message and obtaining the descrambling key upon said authenticating (column 5 lines 22-67).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to send the digitally signed encrypted message and authenticate the source of the digitally signed encrypted message in response to said digitally signed encrypted message. One of ordinary skill in the art would have been motivated to do this because the publisher does not need a database for content key management, since the key and the retrieval information are stored together in the cryptolope and therefore easing content delivery management (Xiao column 5 lines 35-45).

Claims 15, and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wasilewski et al (6,424,714 B1) in view of Pinder et al (5,742,677).

In reference to claim 15 and 18, Wasilewski discloses a system that provides conditional access to services (abstract), wherein the user can select an event (column 30 lines 32-47. The agent responds to the customer order by sending an EMM containing the necessary entitlement information (column 30 lines 48-67). Wasilewski further discloses the secure delivery of the event (programs) from the service provider to the customer set top unit (abstract). Wasilewski discloses receiving at the device the encrypted message (column 7 lines 1-17).

Wasilewski does not expressly disclose indicating the events that are available to the customer in the form of an electronic list of events.

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to indicate the customer the types of events that are available in the form of a list

Art Unit: 2135

of events. One of ordinary skill in the art would have been motivated to do this because a list is an organized and simple way of communicating information.

However Wasilewski do not disclose the use of digital certificates in an electronic program guide.

Pinder discloses the use of the private key used for digital signatures (column 5 lines 33-34).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to use the private key for a digital signature created using a private key as in Pinder in the system of of Nagel. One of ordinary skill in the art would have been motivated to do this because the digital signature operations provide authentication (Pinder column 5 lines 34-35).

Although Wasilewski discloses the secure delivery of the event (programs) from the service provider to the customer set top unit (abstract), Wasilewski does not disclose a encrypted message comprising an descrambling key and authenticating a source of the digitally signed encrypted message in response to said digitally signed encrypted message and obtaining the descrambling key upon said authenticating.

Xiao discloses a method, apparatus and article of manufacture for a computer-implemented method of delayed secure data retrieval (abstract). The system comprises an encrypted message comprising a content key (descrambling key) and a description of the digital content (column 4 lines 17-33). The system authenticates a source of the digitally signed encrypted message in response to said digitally signed encrypted message and obtaining the descrambling key upon said authenticating (column 5 lines 22-67).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to send the digitally signed encrypted message and authenticate the source of the digitally signed encrypted message in response to said digitally signed encrypted message. One of ordinary skill in the art would have been motivated to do this because the publisher does not need a database for content key management, since the key and the retrieval information are stored together in the cryptolope and therefore easing content delivery management (Xiao column 5 lines 35-45).

Claims 2-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wasilewski, Pinder, and Hendricks in view of Vancelette.

In reference to claim 2, the steps of decrypting said message, receiving said selected event, and descrambling said selected event are performed in a smart card coupled to the device (column 9 lines 26-33). The message being encrypted using a public key associated with said smart card and said step of decrypting uses a private key associated with and stored in said smart card, Vancelette suggests that this data is encrypted on the smart card since in the downloadable form the data is encrypted with the other data (column 6 lines 57-65).

In reference to claim 3, said message further comprises event information, said event information being decrypted using said private key (column 9 lines 54-67 in combination with column 6 lines 56-64).

In reference to claim 4, the event information is stored where the step is performed in the smart card (column 9 line 26-30). The information is downloaded to the terminals memory, the

Art Unit: 2135

smart card has memory also and is situated at the terminal and is therefore available memory for the storage of the downloaded information.

In reference to claim 5, the smart card has a card body having a plurality of terminals arranged on a surface of said card body in accordance with one of ISO 7816 and PCMCIA card standards. It is inherent that the card body has terminals on its body for connection to the card reader for accessing the memory of the card.

In reference to claim 6, authenticating said list of events to verify the origin of said message. The events in the list are authenticated by the virtue of the list being encrypted by the service provider. The terminal then decrypts the packets with the corresponding key. This implies that only those with the key that corresponds the key of the service provider can decrypt the list and therefore the information comes from the service provider (column 9 lines 4-6).

In reference to claim 8, event information comprises channel identification data, event identity data, date and time stamp data, and billing data (column 2 lines 59-65).

In reference to claim 9, further comprising the step of storing said event information, wherein said step of storing said event information is performed in said device (column 9 lines 27-30).

In reference to claims 13 and 14, said event information is used within said device to update said user's account information (column 2 lines 59-65).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to use the smart card as in Vancelette in the system of Wasilewski. One of ordinary skill in the art would have been motivated to do this because smart cards are small and portable and have the processing power to perform encryption.

In reference to claims 7, Pinder discloses the use of the private key used for digital signatures (column 5 lines 33-34).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to use the private key for a digital signature created using a private key as in Pinder in the system of Wasilewski. One of ordinary skill in the art would have been motivated to do this because the digital signature operations provide authentication (Pinder column 5 lines 34-35).

In reference to claim 10, digital signature, said second public key and said second private key are issued by an independent certificate authority and are associated with said list provider (Pinder column 10 lines 16-20).

In reference to claim 11, said device is a digital television. The device suggested by Vancelette is a display device, 80, a digital television is a display device and is therefore the device suggested by Vancelette.

In reference to claim 12, said device is a set-top box (column 6 lines 43-45).

Claims 16-17 and 19-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wasilewski and Pinder in view of Vancelette.

In reference to claims 16 and 19, the device is a set-top box (column 6 lines 43-45).

In reference to claims 17 and 20, the device is a digital television. The device suggested by Vancelette is a display device, 80, a digital television is a display device and is therefore the device suggested by Vancelette.

Art Unit: 2135

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Paula W. Klimach whose telephone number is (571) 272-3854. The examiner can normally be reached on Mon to Thr 9:30 a.m to 5:30 p.m.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kim Vu can be reached on (571) 272-3859. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
